

Simulating Deformable Objects

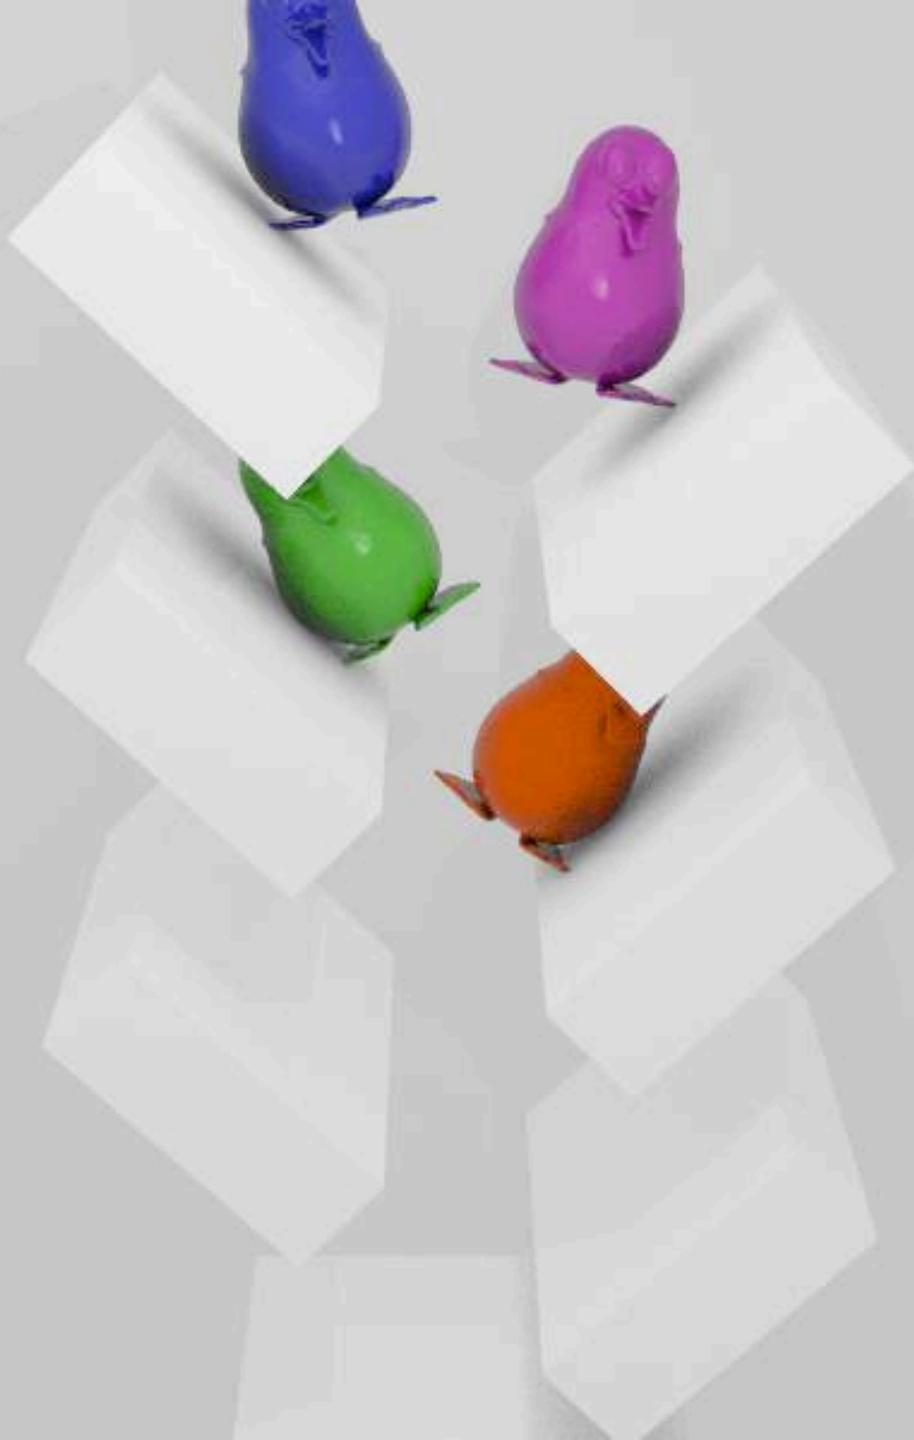

David Levin

Department of Computer Science

Questions

Plan for Today

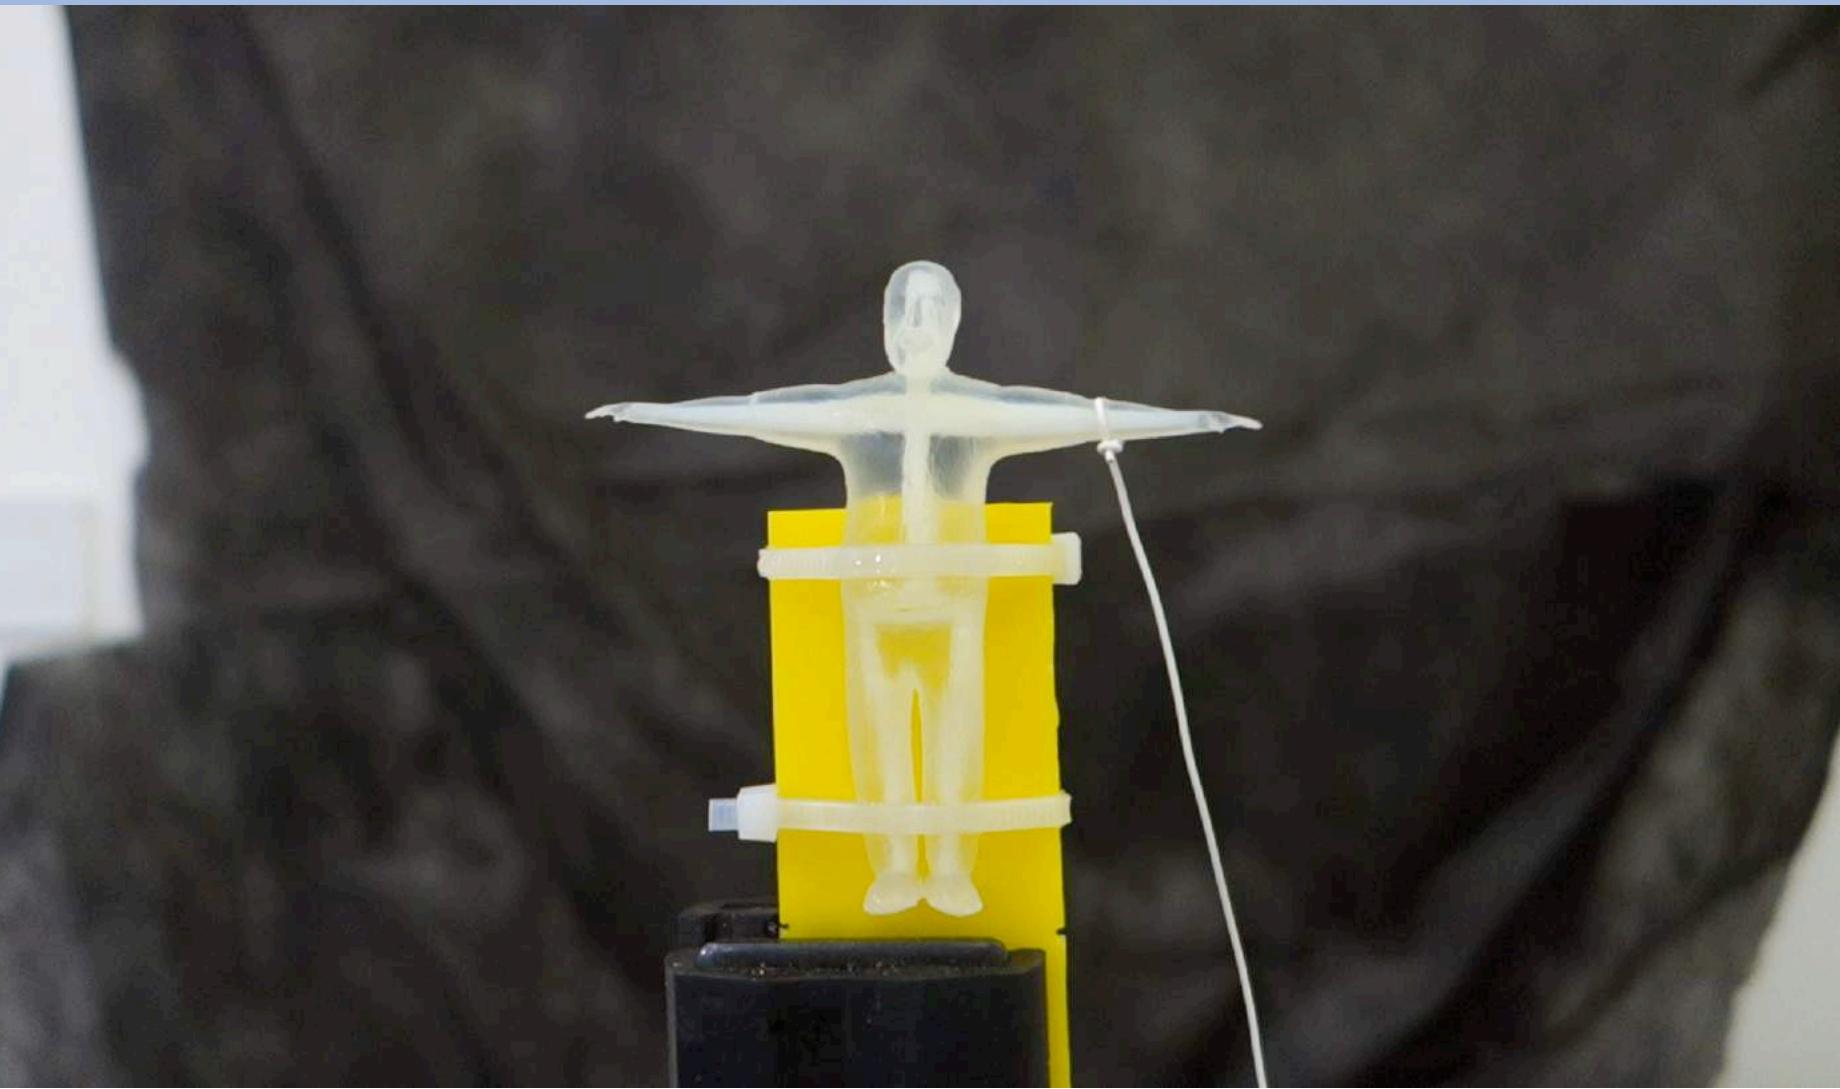

- Introduction to Physics Simulation
- Mass-Spring Simulation

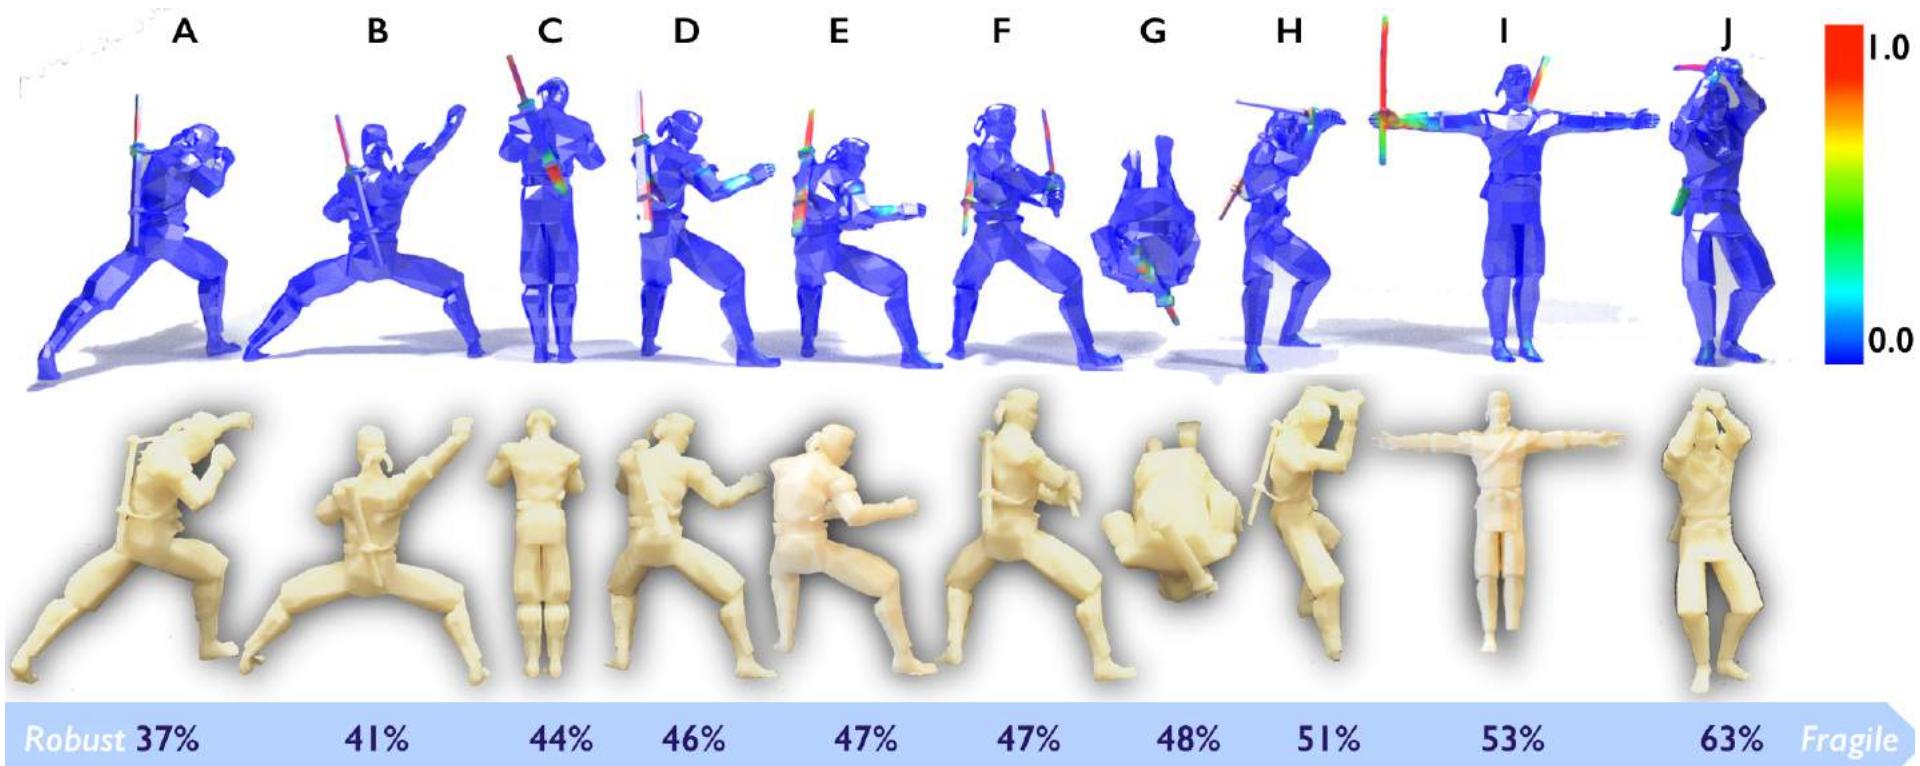

Simulation is a big word

- Definition: Imitation of a situation or process
- We are going to focus on simulation of deformable solid bodies like what we've seen in the preceding videos
- This is very useful for fabrication because ...

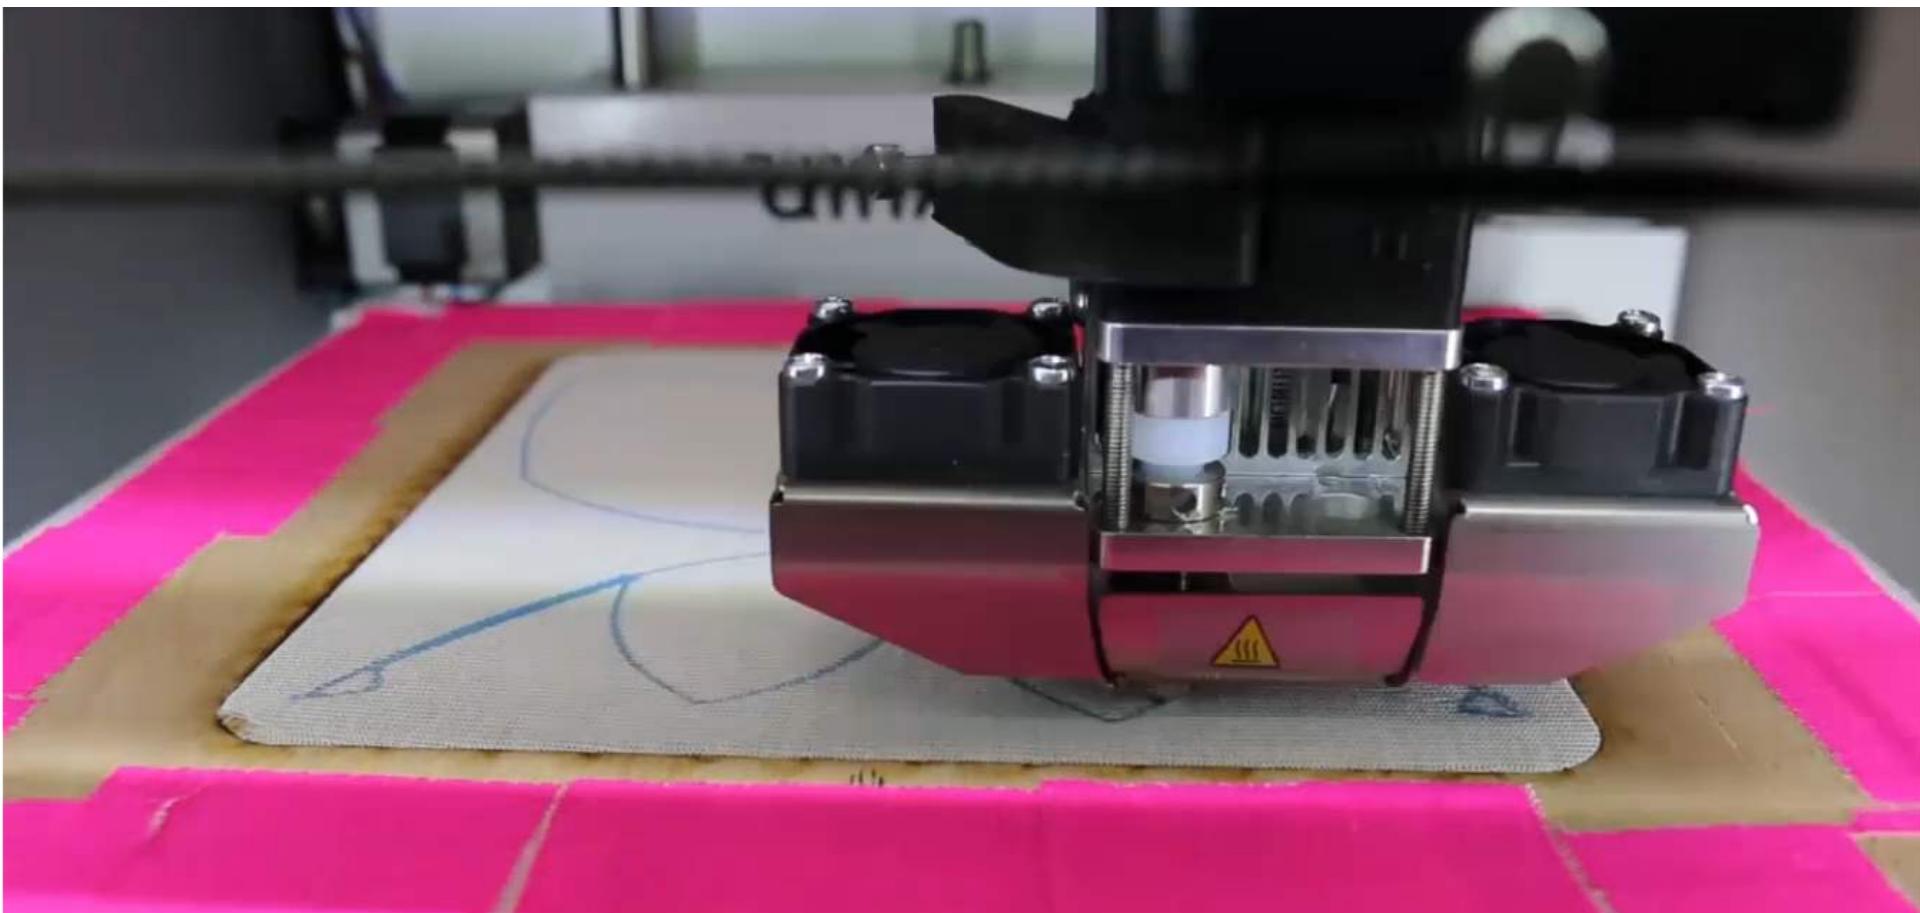

We might want to know how things bend

We might want to know when things break

We might want to know how things will change shape

Newton's Second Law

In 1D

$$\frac{f}{T} = \frac{1}{m} \frac{a}{T}$$

mass (kg)

force (N) acceleration (m/s)

Statics vs. Dynamics

Newton's law describes time varying motion of an object.

Recall: $a = \ddot{x}(t) = \frac{d^2 u}{dt^2}$

Newton's law $\rightarrow m\ddot{x}(t) = F$
Integrate to get $x(t)$.

Statics vs. Dynamics

We call this time varying motion
“Dynamics”

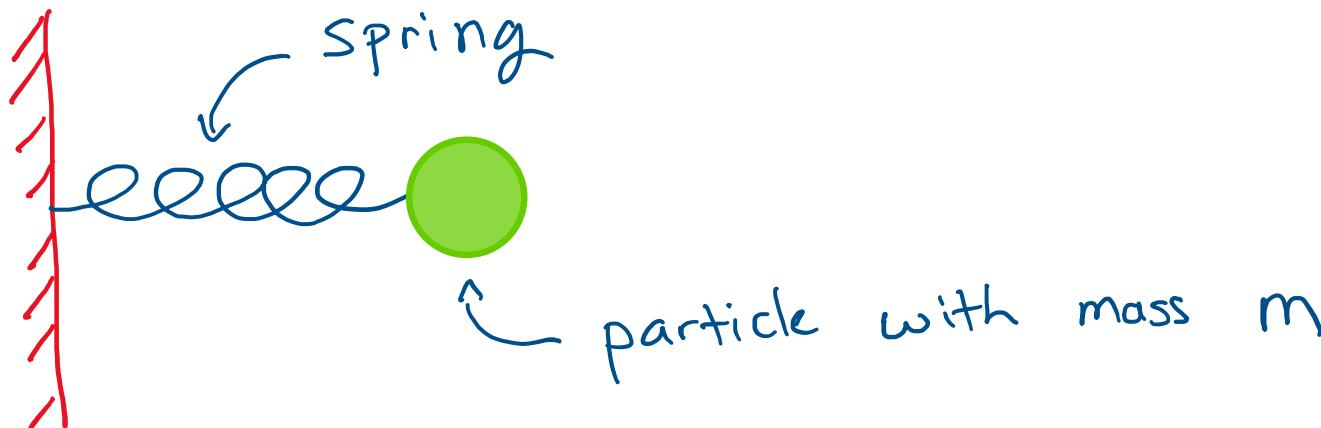

“Statics” is concerned with the
case $\ddot{u}(t) = 0$, or $F = 0$

We'll talk more about statics next
lecture.

Today: Crash Course in Dynamics

1. 1D Example Mass Spring System
2. Generalizing Newton's Law
 1. Kinetic and Potential Energy
3. 3D Mass Spring System
4. Numerical Time Integration
 1. Explicit Integration
 2. Implicit Integration
5. Implicit Integration as Optimization (If there's time)

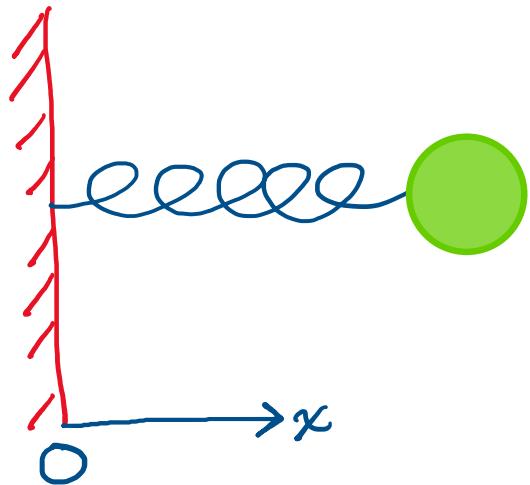

1D Mass Spring System

Fixed Boundary

Hookes Law: force exerted by a spring is linearly proportional to its stretch

1D Mass Spring System

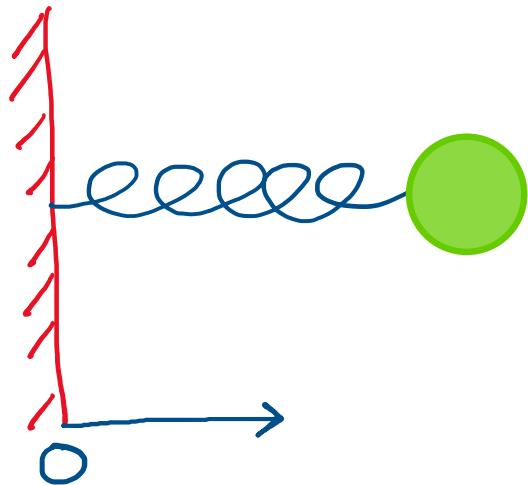

Assume spring has \emptyset rest length.

i.e $F = 0$ when
Position of mass is $x = 0$

Let $x(t)$ be position of mass at time t

Let $F_{\text{spring}} = -k \frac{x(t)}{T}$
Spring constant

1D Mass Spring System

Newton's Law:

$$ma = F$$

$$m\ddot{x}(t) = -kx$$

Step 1: Rewrite as 1st order system

$$\begin{aligned} m\ddot{x} &= -kx \\ \dot{x} &= v \Rightarrow \end{aligned} \quad \begin{bmatrix} \dot{x} \\ v \end{bmatrix} = \underbrace{\begin{bmatrix} 0 & I \\ -\frac{k}{m} & 0 \end{bmatrix}}_A \begin{bmatrix} x \\ v \end{bmatrix}$$

Step 2: Eigen problem

$$\begin{bmatrix} x \\ v \end{bmatrix}(t) = \exp(At) \begin{bmatrix} x_0 \\ v_0 \end{bmatrix}$$

1D Mass Spring System

Generalizing Newton's Law

Re-interpret Newton's law:

$$m\ddot{x} = F \rightarrow m\ddot{x} - f = 0$$

We want this to equal zero.

What question does this raise ?

Generalizing Newton's Law

Re-interpret Newton's law:

$$m\ddot{x} = F \rightarrow m\ddot{x} - f = 0$$

We want this to equal zero.

What question does this raise?

Can we solve this as an optimization?

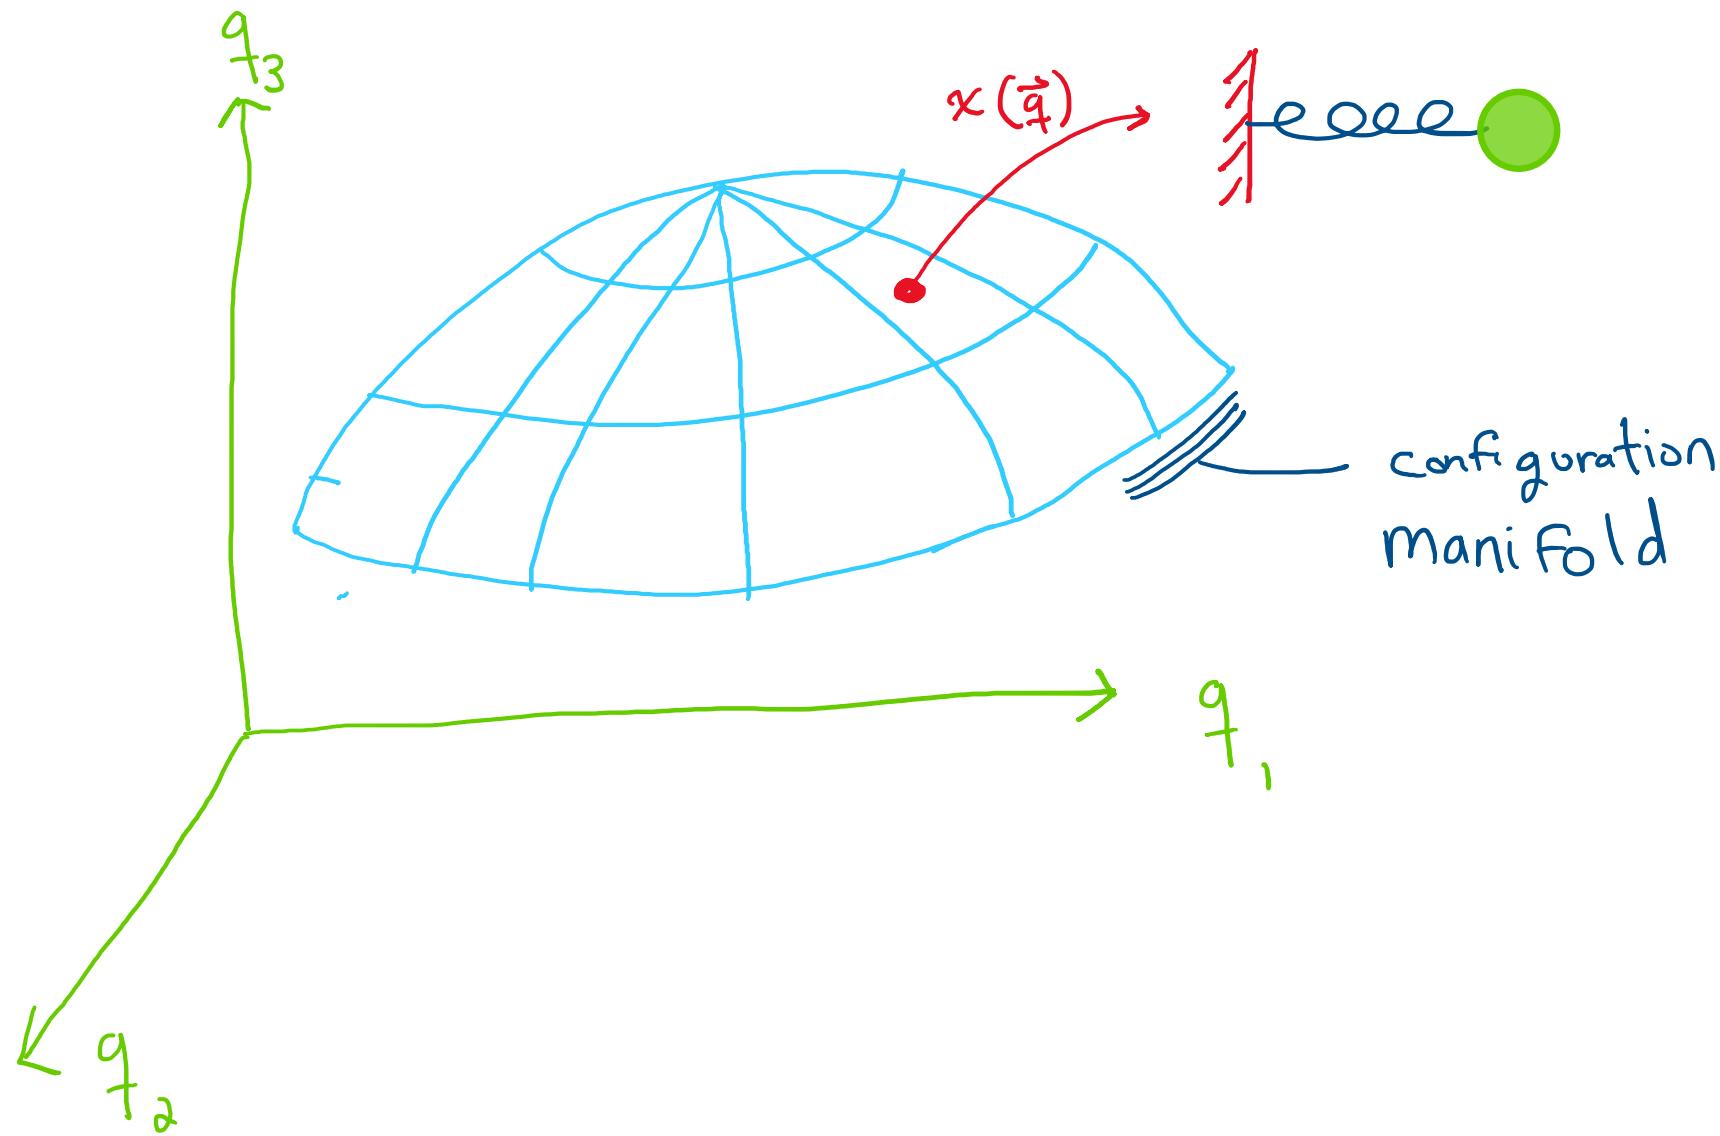

Kinetic and Potential Energy

We can but we need some new concepts.

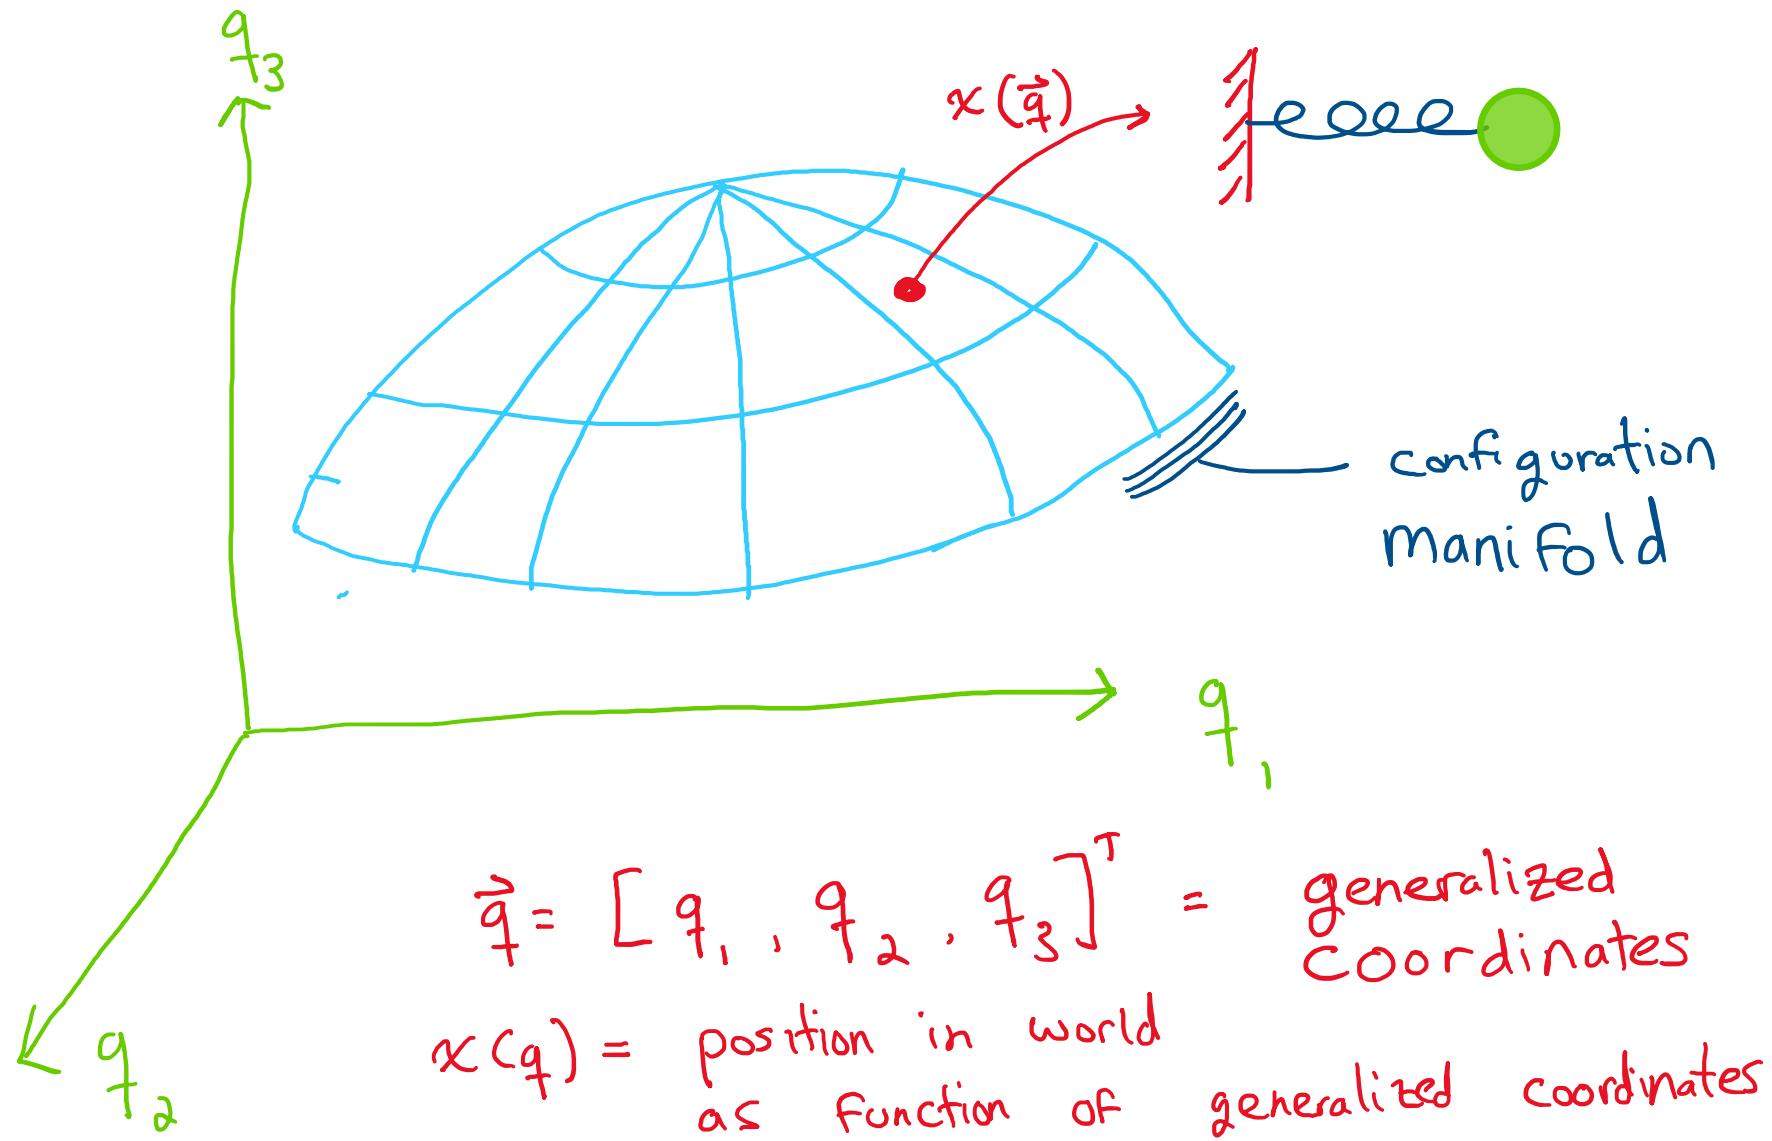

Kinetic Energy: Energy due to motion

Potential Energy: Energy due to position

Generalized Coordinates and Configuration Space

Generalized Coordinates and Configuration Space

Generalizing Newton's Law

We are going to build a function called the Lagrangian:

$$L(\vec{q}) = \underbrace{T(\dot{q})}_{\text{Kinetic Energy}} - \underbrace{V(q)}_{\text{Potential Energy}}$$

Generalizing Newton's Law

Hamilton's Principle of Least Action:

Define $S(q, \dot{q}) = \int_0^t T(\dot{q}(t)) - V(q(t)) dt$

$$\dot{q} = \frac{dq}{dt}$$

Any physical trajectory $q(t)$, "extremizes" S .

Q: How do we extremize S ?

Lagrangian Mechanics

This method of finding q is named after its inventor Lagrange.

Let's go through this for a single spring and mass in 3D

Start by choosing $\vec{q}(t) = \vec{x}(t)$
 $\therefore \vec{x}(q) = \vec{q}, \quad \vec{q} \in \mathbb{R}^3$

Lagrangian Mechanics

Step 1: Define Kinetic Energy (T)

Standard Definition for a particle is

$$T = \frac{1}{2} m v(t)^T v(t)$$

$\hookrightarrow \frac{dx}{dt} = \frac{dq}{dt} = \dot{q}$

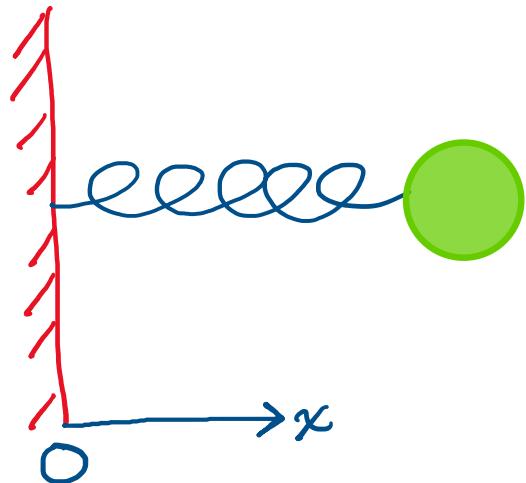

$$\Rightarrow T(\dot{q}) = \frac{1}{2} m \dot{q}^T \dot{q}$$

Lagrangian Mechanics

Step 2: Define Potential Energy

We want an energy that is \emptyset when the spring is in its rest configuration

when $x = q = 0$,
potential energy is minimized.

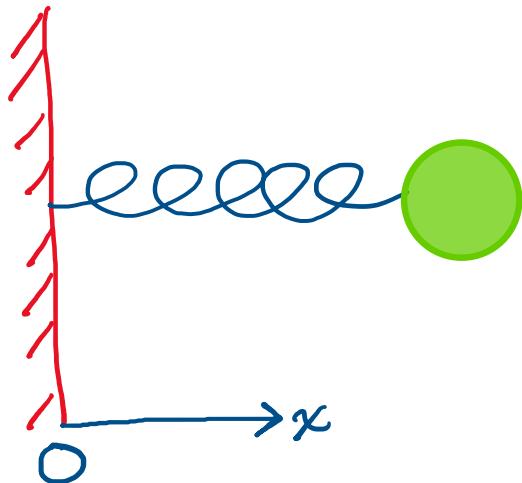

Q: What simple formula could we use?

Lagrangian Mechanics

Step 2: Define Potential Energy

$$\begin{aligned}\text{Potential Energy} &= \frac{1}{2} K \|x\|_2^2 = \frac{1}{2} K x^T x \\ &= \frac{1}{2} K q^T q = V(q)\end{aligned}$$

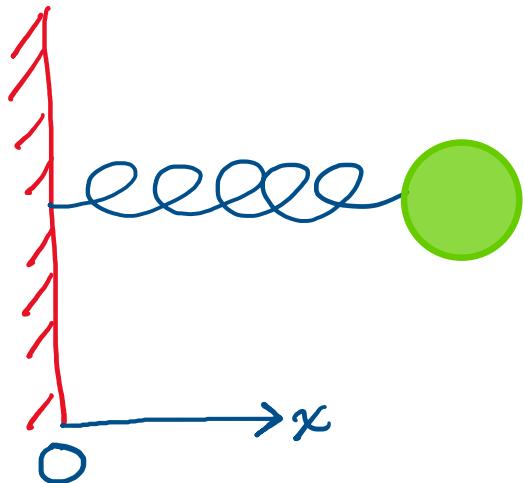

Lagrangian Mechanics

Step 3: Form Lagrangian + S

$$L = V - T = \frac{1}{2} m \dot{q}^T \dot{q} - \frac{1}{2} k q^T q$$

$$S(q, \dot{q}) = \int \frac{1}{2} m \dot{q}^T \dot{q} - \frac{1}{2} k q^T q dt$$

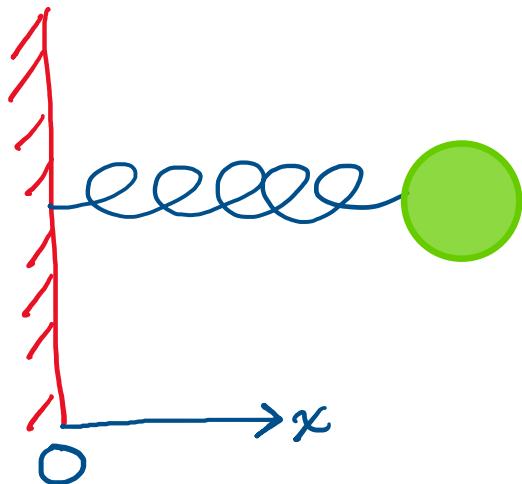

Lagrangian Mechanics

Step 4: Extremize!

Like optimization but with functions.

Given a function $f(y, \dot{y} \dots)$, find function $y(t)$ that minimizes F

F - called a functional

4a.) assume $y(t)$ extremizes F

4b.) perturb $\tilde{y}(t)$, make sure it doesn't change F

Lagrangian Mechanics

1.) $S(q, \dot{q}) = \int_{t_1}^{t_2} \frac{1}{2} m \dot{q}^T \dot{q} - \frac{1}{2} K q^T q dt$

2.) Assume q, \dot{q} minimize S

3.) Perturb!
small perturbation
 $S(q + \delta q, \dot{q} + \delta \dot{q}) = ?$

Hint: We saw this last lecture

Lagrangian Mechanics

3.) Taylor Expansion:

$$S(q + \delta q, \dot{q} + \delta \dot{q}) \approx S(q, \dot{q}) + \frac{\partial S}{\partial q} \delta q + \frac{\partial S}{\partial \dot{q}} \delta \dot{q}$$

$$\Rightarrow \int_{t_1}^{t_2} m \ddot{q} \delta \dot{q} - \dot{q} \delta q dt$$

4.) Integration by parts

Lagrangian Mechanics

3.) Taylor Expansion:

$$S(q + \delta q, \dot{q} + \delta \dot{q}) \approx S(q, \dot{q}) + \frac{\partial S}{\partial q} \delta q + \frac{\partial S}{\partial \dot{q}} \delta \dot{q}$$

$$\Rightarrow \int_0^t m \ddot{q} \delta \dot{q} - k q \, dt$$

4.) Integration by parts

$$m \dot{q} \delta q \Big|_0^t - \int_0^t m \ddot{q} + k q \, dt$$

Lagrangian Mechanics

Remember we want $\int (q + \delta q, \dot{q} + \delta \dot{q}) = 0$

$$\Rightarrow \frac{\partial S}{\partial q} \delta q + \frac{\partial S}{\partial \dot{q}} \delta \dot{q} = 0$$

$$\Rightarrow m \dot{q} \delta q \Big|_0^t - \int_0^t (m \ddot{q} + K_q) \delta q dt = 0$$

Lagrangian Mechanics

Remember we want $S(q + \delta q, \dot{q} + \delta \dot{q}) = 0$

$$\Rightarrow \frac{\partial S}{\partial q} \delta q + \frac{\partial S}{\partial \dot{q}} \delta \dot{q} = 0$$

$$\Rightarrow m \ddot{q} \delta q \Big|_0^t - \int_0^t (m \ddot{q} + k q) \delta q \, dt = 0$$

$\delta q(t) = \delta q(0) = 0$, so just this has to be zero.

$m \ddot{q} = -k q \Rightarrow$ Newton's law! But it works for 3D points.

Lagrangian Mechanics

Important:

$$\text{Force} = -\nabla_q \text{ Potential Energy}$$

$$-KX = -Kq = -\nabla_q \left(\frac{1}{2} K q^T q \right)$$

Lagrangian Mechanics

What about

Spring has rest length l_0

$$\vec{q} = ?$$

$$T = ?$$

$$V = ?$$

Lagrangian Mechanics

What about

Spring has rest length l_0

$$\vec{q} = [\vec{x}_1^T \quad \vec{x}_2^T]^T$$

$$T = m \vec{x}_1^T \vec{x}_1 + m \vec{x}_2^T \vec{x}_2 = \vec{q}^T \begin{bmatrix} m & 0 \\ 0 & m \end{bmatrix} \vec{q}$$

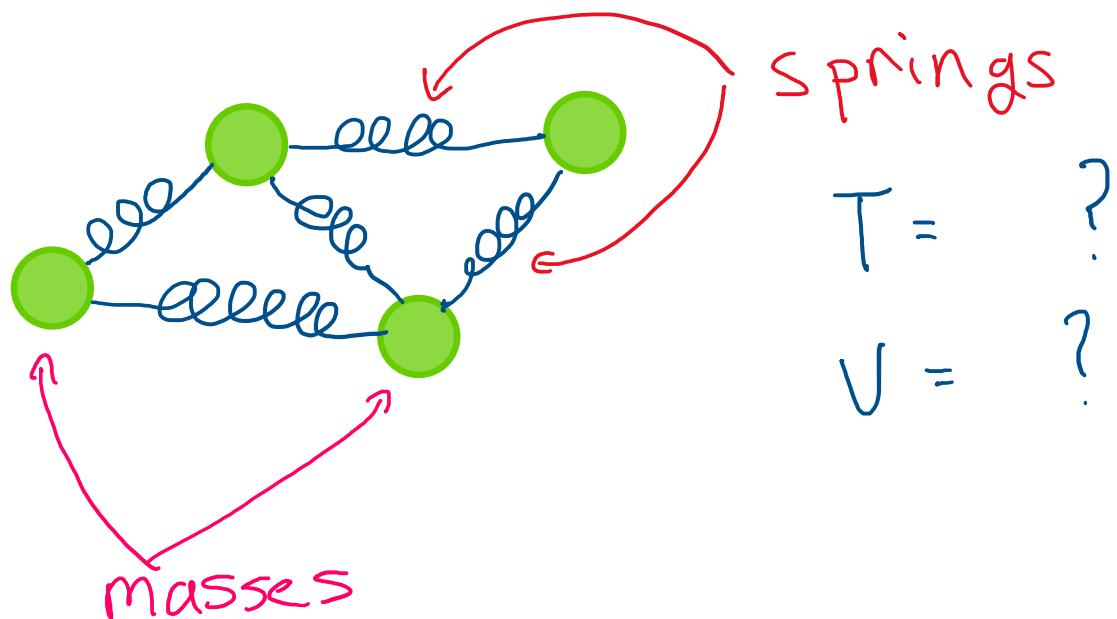

$$V = k \left(1 - \frac{|x_2 - x_1|}{l_0} \right)^2 \quad \text{← measures stretch of spring}$$

Can plug into S to get equation of the form

$$M \ddot{\vec{q}} = F$$

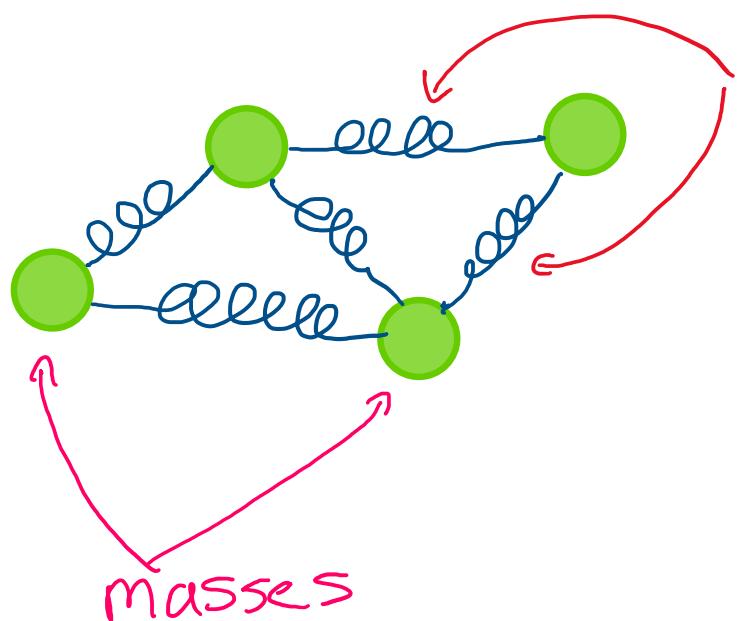

3D Mass Spring System

Upgrade to more springs

3D Mass Spring System

Upgrade to more springs

springs

$$T = ?$$

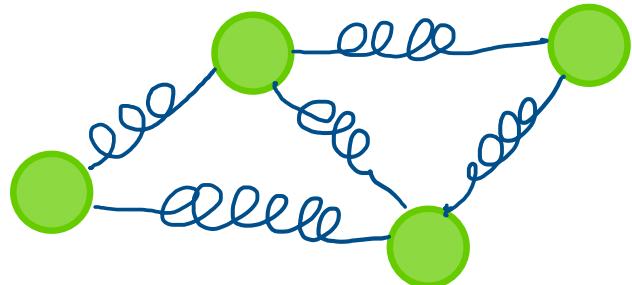

$$V = \sum_{i=1}^{\text{Num Springs}} k \| \mathbf{l}_i \|_2^2$$

END POINTS OF i^{th} SPRING

$$\frac{\| \mathbf{x}_1^i - \mathbf{x}_2^i \|_2}{l_0} \|_2^2$$

Plug into $S \rightarrow M \ddot{q} = f(q)$

3D Mass Spring System

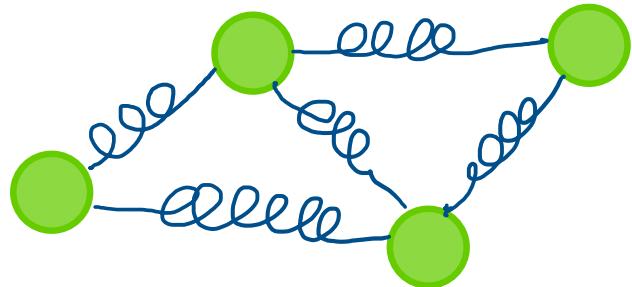

$$M\ddot{q} = f(q)$$

How do I solve this for q ?

Numerical Integration!

Integration

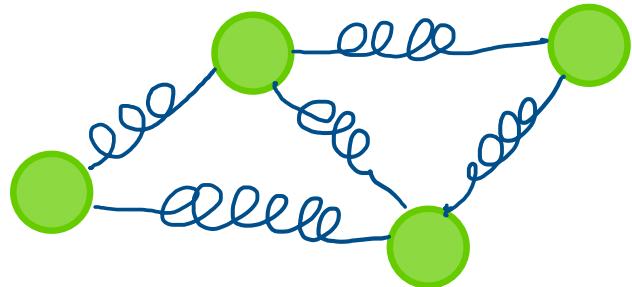

$$M\ddot{q} = f(q)$$

Bring back $v = \dot{q}$

$$\begin{aligned} Mv &= F(q) \\ \dot{q} &= v \end{aligned} \quad \left. \right\} \text{What to do about derivatives?}$$

Integration

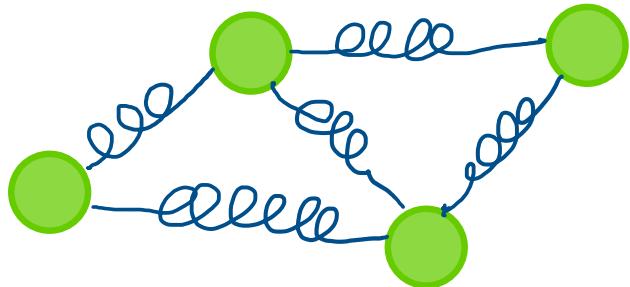

$$M\ddot{q} = f(q)$$

Bring back $v = \dot{q}$

$$\begin{aligned} Mv &= F(q) \\ \dot{q} &= v \end{aligned} \quad] \quad \begin{array}{l} \text{What to do about derivatives?} \\ \text{A: Finite Difference} \end{array}$$

Integration

$$M\ddot{q} = f(q)$$

Bring back $v = \dot{q}$

$$Mi = F(q)$$

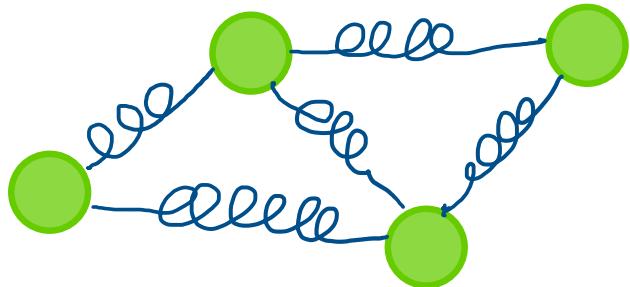

$$\dot{q} = v$$

} What to do about derivatives?

A: Finite Difference

$$\dot{q} = \frac{q^{t+1} - q^t}{h}, \quad \dot{v} = \frac{v^{t+1} - v^t}{h}$$

Explicit Integration

$$M\ddot{q} = f(q)$$

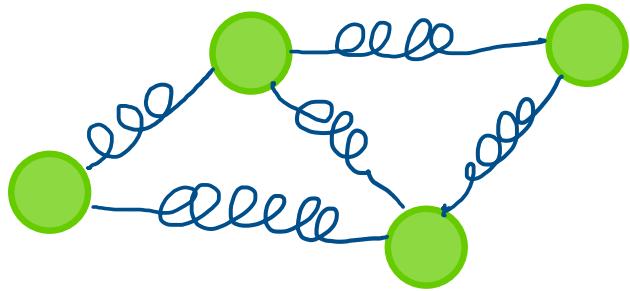

Bring back $v = \dot{q}$

explicit choice

$$Mv^{t+1} = Mv^t + h f(\overline{q^t})$$

$$\overline{q^{t+1}} = \overline{q^t} + h v^t$$

Explicit Integration

$$M\ddot{q} = f(q)$$

Bring back $v = \dot{q}$

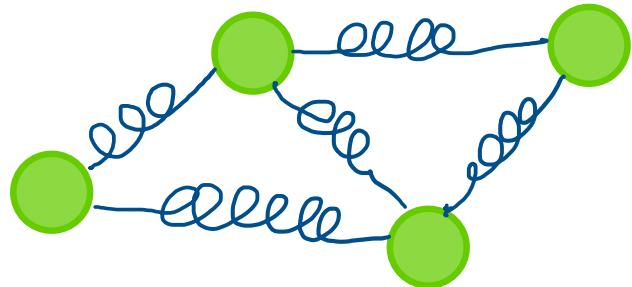

explicit choice

$$Mv^{t+1} = Mv^t + h f(\bar{q}^t)$$

$$\bar{q}^{t+1} = q^t + hv^t$$

Explicit Euler \rightarrow UNSTABLE FOR SPRINGS

Implicit Integration

$$M\ddot{q} = f(q)$$

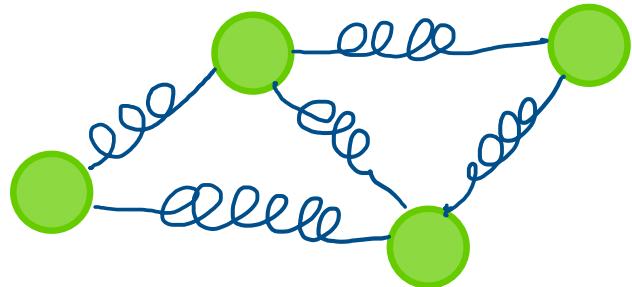

Bring back $v = \dot{q}$

$$\begin{aligned} Mv^{t+1} &= Mv^t + h f(\overset{\downarrow}{q^{t+1}}) \\ q^{t+1} &= q^t + h v^{t+1} \end{aligned}$$

Implicit Choice

How do we solve this ?

Implicit Integration

$$M\ddot{q} = f(q)$$

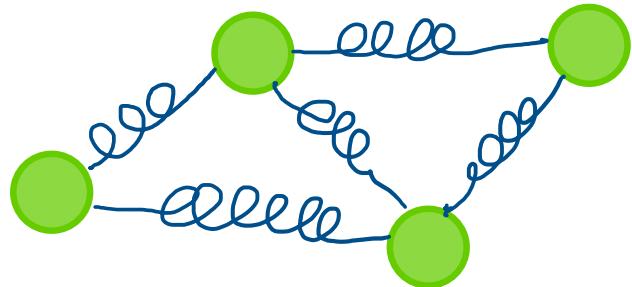

Bring back $v = \dot{q}$

$$\begin{aligned} Mv^{t+1} &= Mv^t + h f(\overset{\downarrow}{q^t} + hv^{t+1}) \\ q^{t+1} &= q^t + hv^{t+1} \end{aligned}$$

Implicit Choice

How do we solve this?

Semi-Implicit Integration

$$M\ddot{q} = f(q)$$

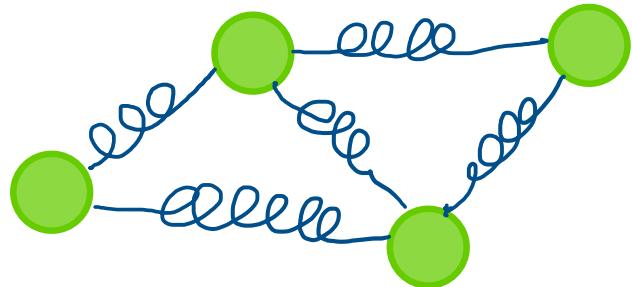

Bring back $v = \dot{q}$

Semi-
Implicit Choice

$$\begin{aligned} Mv^{t+1} &= Mv^t + h^2 \frac{\partial F}{\partial q} \Big|_t v^{t+1} + hF(q^t) \\ q^{t+1} &= q^t + h v^{t+1} \end{aligned}$$

How do we solve this ?

Semi-Implicit Integration

$$M\ddot{q} = f(q)$$

Bring back $v = \dot{q}$

$$(M - h^2 K) v^{t+1} = M v^t + h f(q^t)$$

$$q^{t+1} = q^t + h v^{t+1}$$

How do we solve this?

We can solve this

Stiffness Matrix

Important: $K = -\frac{\partial^2 \text{Potential Energy}}{\partial q^2}$

For assignment 2 you need to derive and implement K for a single spring!

Implicit Integration as Optimization

Let's define an energy

$$E(v^{t+1}) = \frac{1}{2} (v^{t+1} - v^t)^T M (v^{t+1} - v^t) + \Psi(q^{t+1})$$

Then

$$v^{t+1}^* = \operatorname{argmin} E(v^{t+1}) \iff M v^{t+1}^* = F(q^{t+1}^*)$$

How do we prove this?

Implicit Integration as Optimization

Let's define an energy

$$E(v^{t+1}) = \frac{1}{2} (v^{t+1} - v^t)^T M (v^{t+1} - v^t) + \psi(q^{t+1})$$

Then

$$v^{t+1*} = \arg \min E(v^{t+1}) \iff M v^{t+1*} = h F(q^{t+1*})$$

How do we prove this?

$$\text{Show } \nabla_{v^{t+1}} E(v^{t+1*}) = \mathbf{0} \iff M v^{t+1*} = h F(q^{t+1*})$$
